

Reference drift: exact lookup misses, rewrite-aware anchoring verifies transformed spans

Example edit map: user -> account

INPUT

reference

```
name = user.name.strip()  
... return name
```

generated prefix

```
name = account.name.strip()
```

user -> account

EXACT PLD MISS

matches tokens

current suffix
account.name

reference
user.name

NIGHTHAWK

anchors by rewrite

- 1 **inverse map**
account -> user
- 2 **align**
prefix to reference
- 3 **transform**
user -> account
- 4 **verify**
target argmax
